Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: INHIBIN IS A GONADAL GLYCOPEPTIDE THAT INHIBITS 1HE SECRETTON OF FOLLITROPIN BY THE PITUITARY GLAND.
-!- SUBUNIT: DIMERIC, LINKED BY ONE OR MORE DISULFIDE BONDS.
INHIBIN A IS A DIMER OF ALPHA AND BETA-A.
INHIBIN B IS A DIMER OF ALPHA AND BETA-A.
-!- SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BY SIMILARITY.

Identification of transcription factor AP-2-binding sites in the 5'-flanking regions by DNase I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EUT. J. BIOCHEM. 226:751-764(1994).

-!- FUNCTION: INHIBIN IS A GONADAL GLYCOPEPTIDE THAT INHIBITS THE SECRETION: INHIBIN IS A FOLLITROPIN BY THE PITUITARY GLAND.

-!- SUBUNIT: DIMERIC, LINKED BY ONE OR MORE DISULPIDE BONDS.

INHIBIN A IS A DIMER OF ALPHA AND BETA-A.

INHIBIN B IS A DIMER OF ALPHA AND BETA-A.

-!- SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             INTERCHAIN (BY SIMILARITY).

"Expression of inhibin alpha-subunit gene during mouse gametogenesis.";

Differentiation 44:62-68(1990).

-! FUNCTION: INHIBIN IS A GONADAL GLYCOPEPTIDE THAT INHIBITS THE SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND. ON THE OTHER HAND ACTIVIN ACTIVATES THE SECRETION OF FOLLITROPIN.

-! SUBUNIT: DIMERIC, LINKED BY ONE OR MORE DISULFIDE BONDS.

INHIBIN A IS A DIMER OF ALPHA AND BETA-A.

INHIBIN B IS A DIMER OF ALPHA AND BETA-B.

                                                                                                                                                                                                         ·;
                                                                                                       It is a potent bombesin antagonist. It may be used for the treatment of e.g. malignant disease, conditions associated with the over-prodn. of bombesin and conditions associated with failure of normal physiological control of the regulation of gastric acid secretion.
                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The peptide is modified at the N-terminal with a lauryl, palmitoyl or esp. an octanoyl gp. The Leu at position 7 may be absent. The C-terminal (Leu or His) is amidated. The peptides and derived salts can be used to treat small cell lung carcinoma, prostatic carcinoma, tumour tissue growth, peptide ulcers, cancer and associated conditions, and to effect antagonism of bombosin/gastrin releasing peptide. Dosage is 0.2-250 mg/kg daily in 1-4 doses, at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide bombesin-GRP antagonists - used as antitumour agents to treat e.g. leukaemia, small cell lung and prostatic carcinoma and to inhibit gastric acid secretion.
                                   New Neuromedin C polypeptide derivs. - are potent bombesin antagonist used for treating malignant disease and conditions associated with gastrin or gastric acid secretion

The peptides in this example are bombesin analogues. The peptides were tested in a competitive binding assay and a Phosphatidyl Inositol (PI)-turnover assay in mouse pancreas. None of the peptides demonstrated agonist activity but all inhibited PI-turnover (c.f. stimulation produced by 100nM GRP). Analogues of bombesin are potentially useful for growth therapy and the treatment of digestive disorders, e.g. for stimulating digestion, stimulating growth of tissue in the lung, pancreas and intestine, stimulating with cell activity against tumour cells and stimulating growth of tumours to

The peptide may be used as an antimitotic and antisecretory peptide. It can control growth of small cell lung and prostatic carcinomas, and it can also inhibit gastric secretions which are causative and symptomatic of peptic ulcers. Administration may be oral but is preferably subcutaneous, intravenous, intranscular or intraperitoneal, by depot injection, by implant preparation or by application to the mucous membranes (e.g. of the nose or bronchial

                                                                                                                                                                                                                                                                                                                                                                                               This peptide is a specifically claimed example of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to an amide and Phe 8 has been replaced by beta-Leu. Gly 6 has also been replaced by D-Ala. The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                    New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.

```
These peptides are specifically claimed examples of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to a methylester. The peptide is useful for treating benign or malignant tissum proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as compettive inhibitors of natural peptides, since they bind to the cell receptors but have no biological.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

The patent discloses (1) the peptide sequence of bombesin (BBN), gastrin releasing peptide (GRP), Neuromedin B or Neuromedin C, the peptide sequence having a chlorambucil group attached to the amino terminal; (2) a BBN receptor antagonist of formula and control of the sequence having a chlorambucil group attached to the amino terminal; (2) a BBN receptor antagonist of formula R Asn.R3-Trp-Ala-Val-R2-His-Leu-CO-CH2CH3.

R 4-His-Trp-Ala-R1-R2-His-R3-CO-CH2CH3.
In these formulae, R1 = Val or Thr: R2 = Gly or D-Ala: R3 = Leu or Phe: R4 = N-acetyl, bromoacetyl, chloroacetyl, [bis(2-chloroethyl)].

Phe: R4 = N-acetyl, bromoacetyl, chloroacetyl, [bis(2-chloroethyl)].

R 6 = N-acetyl, bromoacetyl, chloroacetyl, [bis(2-chloroethyl)].

The compounds act as potent BBN/GRP-like peptide antagonists. They can be used to inhibit the growth-promoting effects of BBN, GRP or a related peptide such as proceed to cancerous cells, gastric cells, neurons, hypothalamic cells and cancerous cells or tumours. They can also be used to inhibit the binding of BBN, GRP or a related peptide to cells capable of such binding. They can be used for treating e.g. peptic ulcer, pancreatitis, eating disorders, diabetes, acromegaly, enterocutaneous fistula, psoriasis, growth retardation, gastrointestinal motility disorders or tumours. The terminal structures of the compounds protect them from the vivo protecolysis and provided highly potent antagonist effects that persist for extended periods of time upon administration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                 The inventors claim 36 peptides. Also claimed are:
(a) pharmaceutical prepn. of a peptide of the invention; (b) prepn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is a peptide analogue of mammalian gastrin releasing peptide (GRP), neuromedin-B or -C, amphibian bombesin and litorin. It is an agonist of these cpds, and is used to treat smooth muscule proliferation and cancer of the prostate, breast or lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    - by

The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either litorin; the 10 amino acid C-terminal requestion of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by stendard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide agonists of litorin, gastrin releasing peptides neuromedin B or C or bombesin, for treating cancer, p_1,\dots,p_{1,n} smooth muscle proliferation and suppressing appetite and alcohol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tissue proliferation; gastrin related peptide; peptide hormone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either literin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide agonists of litorin, gastrin releasing peptide -
neuromedin B or C or bombesin, for treating cancer, preventing
smooth muscle proliferation and suppressing appetite and alcohol

The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide agonists of litorin, gastrin releasing peptide -
neuromedin B or C or bombesin, for treating cancer, preventing
smooth muscle proliferation and suppressing appetite and alcohol

Natl. Acad. Sci. U.S.A. 89:9819-9822(1992).

-!- FUNCTION: MAY BE A GROWTH FACTOR REQUIRED FOR THE HIGH RATE OF CELL DIVISION ENSUING AFTER FERTILIZATION, OR MAY HAVE A ROLE AS A SECRETAGOGUE THAT TRIGGERS THE RELEASE OF STORED COMPONENTS.
-!- TISSUE SPECIFICITY: BRAIN, INTESTINE, AND OVARIES AND EARLY EMBRYOS (STAGES 2 AND 10).
-!- SIMILARITY: BELONGS TO THE BOMBĘSIN/NEUROMEDIN B/RANATENSIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
